Report Overview

Siliceous fertilizers are a category of agricultural products specifically designed to enrich soil with silicon, an essential nutrient for plant growth. These fertilizers contain high levels of silicate minerals, which are derived from natural sources such as rock powder, volcanic ash, or other silicate-rich materials. When applied to soil or directly to plant foliage, siliceous fertilizers help to improve soil structure, enhance water retention, and boost plant resistance to diseases and pests. They also promote stronger root development and overall plant vigor, leading to increased crop yields and quality. The use of siliceous fertilizers is particularly beneficial in regions with low silicon content in the soil or in crops that have a high demand for silicon, such as rice, wheat, and sugarcane.
