Abstracts

The silicon-based analog beamforming chip is a chip manufactured based on silicon-based integrated circuit technology and is used for beamforming applications in radio frequency (RF) and millimeter wave bands. Beamforming is a technology that can make the directionality of the transmitted or received signals more concentrated or directional by adjusting the phase and amplitude of the signal, thereby improving the performance and coverage of the communication system. Silicon-based analog beamforming chips usually integrate a large number of functional modules such as RF switches, phase shift devices and power amplifiers, which can implement complex beamforming algorithms and process RF signals in real time. This kind of chip has broad application prospects in 5G communication systems, millimeter wave radar, wireless communication systems and other fields, because it can implement complex radio frequency signal processing functions at lower cost and smaller size.

The global Silicon Based Analog Beamforming Chip market size was estimated at USD 1250.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.45% during the forecast period.
