Report Overview

Silicone for drug delivery systems refers to biocompatible, elastomeric materials used to control the release of pharmaceutical compounds in targeted therapies. These systems leverage silicone's inertness, flexibility, and permeability to design implants, transdermal patches, and localized delivery mechanisms that ensure precise dosing over extended periods. Applications range from hormone-releasing implants (e.g., contraceptive devices) to programmable reservoirs for chronic conditions like diabetes or cancer. The material's stability under physiological conditions, coupled with its ability to be engineered for specific drug-release profiles (diffusion-based or matrix-controlled), makes it a critical component in personalized and sustained-release therapies. Innovations focus on enhancing biodegradability and combining silicone with smart polymers for stimuli-responsive delivery.
