Report Overview

The silicone gastrostomy catheter is a medical device designed for enteral feeding, typically used in patients who cannot consume food orally due to conditions such as dysphagia, neurological disorders, or gastrointestinal obstructions. Made from medical-grade silicone, these catheters are flexible, biocompatible, and resistant to degradation, ensuring long-term usability and minimizing tissue irritation. They are inserted directly into the stomach through a surgical or endoscopic procedure (PEG?percutaneous endoscopic gastrostomy) and allow for the delivery of liquid nutrition, medications, or hydration. The design often includes features such as retention mechanisms (balloon or bumper) to prevent accidental dislodgment and low-profile options for improved patient comfort. The market for these devices is driven by an aging population, rising prevalence of chronic diseases, and advancements in minimally invasive surgical techniques, with demand concentrated in hospitals, long-term care facilities, and home healthcare settings.
