Report Overview

Silver-coated Copper Nanoparticles are a type of nanoscale material that combines the properties of both silver and copper. These particles are synthesized by depositing a thin layer of silver onto the surface of copper nanoparticles, resulting in a core-shell structure. The product is characterized by its small size, typically ranging from 1 to 100 nanometers, which endows it with unique optical, electrical, and catalytic properties. Silver-coated Copper Nanoparticles find applications in various fields, including antimicrobial coatings, electronics, and catalysis, due to the synergistic effects of the two metals. The silver layer provides enhanced antimicrobial activity and electrical conductivity, while the copper core contributes to the overall stability and cost-effectiveness of the material.
