Abstracts

Silver sintered pressed IGBT devices refer to power semiconductor devices that use silver sintering technology to press-fit and package the IGBT chip and the substrate. Silver sintering technology is a new connection technology that uses silver powder or silver paste as an intermediate layer material to achieve metallurgical bonding between the chip and the substrate through solid diffusion or liquid sintering under appropriate temperature, pressure and time conditions. Compared with traditional welding processes, this technology has a higher melting point, lower thermal resistance, better thermal conductivity and excellent fatigue resistance. Silver sintered pressed IGBT devices are widely used in new energy fields such as new energy vehicles, smart grids, wind power generation and energy storage due to their excellent performance characteristics. These fields have high performance requirements for IGBT devices and require the devices to maintain stable performance output under high temperature and high power working environments. The emergence of silver sintered pressed IGBT devices provides strong support for the development of these fields.

The global Silver Sinter Press Fit Igbt Device market size was estimated at USD 385.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.45% during the forecast period.
