Report Overview

A Single Core Silicone Cable is a type of electrical cable designed for high-temperature applications and environments. It is constructed with a single core, which is a single strand of conductive material, typically copper, that carries the electrical current. The cable is insulated with silicone, a synthetic rubber material known for its excellent heat resistance, flexibility, and chemical stability. This insulation allows the cable to operate safely and efficiently in temperatures ranging from -60°C to 200°C, making it suitable for use in various industrial, automotive, and electronic applications where resistance to heat and environmental factors is crucial. The single core design simplifies the cable's structure, which can be beneficial for applications requiring minimal space or where complex wiring is not necessary.
