Report Overview

A Single Element Ultrasonic Probe is a type of transducer that is used in ultrasonic testing to identify subsurface defects and measure the thickness of materials. It consists of a single piezoelectric crystal that generates ultrasonic waves when subjected to an electrical voltage. These waves travel through the material being tested and are detected by the same crystal when reflected back. The time it takes for the wave to travel and return can be used to calculate material thickness and locate hidden flaws such as cracks, voids or inclusions.
