Report Overview

A Single Flanged Rail Wheel is a specialized type of wheel designed for use in railway systems. It is characterized by a single flange on the outer edge of the wheel, which serves to guide the wheel along the rail tracks and prevent derailment. This design is crucial for maintaining the stability and safety of trains as they traverse various types of terrain and track conditions. The flange also plays a role in distributing the lateral forces that the wheel experiences, which can be particularly important during high-speed travel or when navigating tight curves. The Single Flanged Rail Wheel is typically made from robust materials such as steel or cast iron to withstand the high pressures and wear associated with rail travel. Its design and manufacturing must adhere to strict industry standards to ensure compatibility with various rail systems and to meet performance and safety requirements.
