### Report Overview

A single ion implanter refers to an ion implantation device that can only inject one type of ion. It extracts the required single ion type from the ion source through specific technical means, accelerates to obtain a certain amount of energy, forms an ion beam, and then accurately injects it into the surface or a specific depth of the semiconductor material, thereby achieving a change in the properties of the semiconductor material. The ion source of the single ion implanter is a key component for generating the required ions. In the ion source, the gaseous particles of the impurity element are ionized into ions by heating or other means. The ionized ions are passed through an accelerator to obtain higher energy, and the shape and direction of the ion beam are adjusted through a focusing system to ensure that the ions can be accurately injected into the target location. In a vacuum environment, the high-energy ion beam is guided to the surface of the semiconductor material and injected into the material. The injection process can accurately control parameters such as injection dose, injection angle and injection depth.
