Abstracts

Single-mode photonic crystal fiber is a special type of fiber with a complex refractive index distribution on its cross-section and usually contains periodically arranged air holes. The size of these air holes is roughly equivalent to the wavelength of the light wave. The characteristic of single-mode photonic crystal fiber is that it can support only one mode of transmission in a wide wavelength range, that is, the light has only one propagation direction and vibration mode, and no mode coupling or energy propagation to other modes will occur. Single-mode photonic crystal fiber has many unique properties and applications, such as achieving hollow-core low-loss transmission, enhancing nonlinear effects, controlling dispersion and birefringence, etc.

The global Single Mode Photonic Crystal Fiber market size was estimated at USD 320.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
