### Report Overview

A Single Phase Surge Suppressor is an electrical device designed to protect sensitive equipment from voltage surges and spikes in a single-phase electrical system. It is typically installed between the power source and the equipment to be protected, acting as a safeguard against transient voltage events that can cause damage or malfunction. These surge suppressors work by diverting excess voltage to the ground, thereby preventing it from reaching the connected devices. They are commonly used in residential, commercial, and industrial settings to safeguard electronics such as computers, appliances, and machinery from power surges caused by lightning strikes, electrical faults, or other disturbances in the power grid. The effectiveness of a single phase surge suppressor is often measured by its ability to absorb and dissipate energy during a surge event, as well as its response time and clamping voltage, which are critical factors in determining the level of protection provided.
