Abstracts

Single-Photon Avalanche Diode (SPAD) is a photodetector for next-generation semiconductors that is extremely efficient enough to detect even single photons⁹ due to its very high gain. When a higher voltage than the Breakdown Voltage¹⁰ is applied to SPAD, the impact ionization phenomenon occurs in which a huge electric field accelerates carriers which makes them clash with atoms, increasing the number of free carriers released from the atoms. This phenomenon is called Avalanche Multiplication and results in a large number of free carriers created by photons lit up by image sensors. This means that it can amplify photons and recognize them as a much larger number of photons even though only a small number of them were actually captured, due to dark surroundings or if light was emitted from a far distance.

The global Single Photon Avalanche Diode Spad Sensor market size was estimated at USD 780.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 18.40% during the forecast period.
