Report Overview

A Single-Point Time-of-Flight (ToF) Ranging Sensor is a sophisticated electronic device designed to measure the distance between the sensor and an object by calculating the time it takes for a light signal to travel to the object and back. This technology uses the principle of ToF, which involves emitting a pulse of light and then measuring the time delay until the reflected light is detected by the sensor. The product is characterized by its high precision, fast response time, and robustness against ambient light variations. It is commonly used in various applications such as obstacle detection, gesture recognition, and 3D mapping in robotics, automotive, and industrial automation sectors. The Single-Point ToF Ranging Sensor provides a direct and accurate distance measurement, making it a valuable tool for applications requiring precise spatial awareness and object detection.
