Report Overview

A Single-use Endoscopic Vessel Harvesting System is a specialized medical device designed for the minimally invasive extraction of blood vessels, typically for use in coronary artery bypass graft (CABG) surgery. This system employs endoscopic technology, which allows for the visualization and manipulation of the vessel within the body, minimizing the need for large incisions. The system is designed to be used only once to maintain sterility and prevent cross-contamination, ensuring patient safety. It typically consists of a set of instruments including an endoscope, dissecting tools, and retrieval devices, all engineered to work in conjunction to harvest vessels such as the radial artery or saphenous vein with precision and minimal trauma to the patient. The use of such systems can lead to reduced surgical site infections, faster recovery times, and improved cosmesis due to the smaller incisions required.
