Report Overview

A siphon coffee pot, also called a vacuum coffee pot, in which heating and cooling the lower container changes the vapor pressure of the water in the lower container, first pushing the water into the upper container and then allowing it to fall back into the lower container. When the coffee finishes brewing (about 60 seconds), the heat is removed and the pressure in the bottom container drops, so gravity (acting on the water) overcomes the pressure difference in the chambers and the coffee pulp descends into the lower chamber through the filter, ending the brew. The coffee can then be poured out of the lower chamber. Usually the unit must be disassembled to pour out the coffee.
