Report Overview

A slide valve type vacuum pump is a type of positive displacement pump that uses a sliding piston or slide valve to create a low-pressure environment within an enclosed chamber. This pump operates by continuously compressing gas molecules from the intake port to the exhaust port, creating a vacuum in the process. The slide valve type vacuum pump consists of a stationary cylinder containing a sliding piston or slide valve, with an inlet port located near the top and an exhaust port located near the bottom. As the piston or slide valve moves up and down within the cylinder, it alternately creates a vacuum at the inlet port and compresses gas molecules towards the exhaust port. The volume of the enclosed chamber is reduced as the piston or slide valve moves downward, which increases the pressure and forces gas molecules out through the exhaust port.
