Report Overview

Soft seated butterfly valves are a type of quarter-turn rotary valve used for controlling and regulating the flow of various fluids, including gases, liquids, and slurries, in pipelines. These valves are characterized by their butterfly-shaped disk that rotates around its axis to control the flow. The "soft" in their name refers to the use of soft sealing materials, such as rubber or elastomers, for the seats and seals. This feature makes them suitable for applications where a tight seal is required, especially with corrosive or abrasive fluids. Soft seated butterfly valves are known for their low maintenance, good sealing properties, and ability to handle a wide range of flow rates and pressures. They are commonly used in industries such as water treatment, chemical processing, and food and beverage manufacturing due to their versatility and reliability.
