Abstracts

Solvent free polyurethane adhesives are mainly divided into single component and two-component types. The main agent of two-component polyurethane adhesives contains hydroxyl terminated polyurethane prepolymers, and the curing agent contains isocyanate groups; At present, polyurethane prepolymers terminated with isocyanates are still used as the main agent, and different types of products such as polyols or polyamines with low relative molecular weight are selected as curing agents. The solvent-free two-component adhesive has the following advantages: no exhaust gas, solvent pollutant emissions, and strong environmental protection adaptability; High bonding strength, controllable curing time, overcoming drawbacks such as slow curing time of single components and the generation of bubbles; Having excellent shear strength and impact resistance, able to withstand impact vibration and bending fatigue, suitable for various structural bonding fields; Has strong low-temperature resistance performance; The adhesive film has adjustable hardness, simple bonding process, and can cure at room temperature and heating. Due to the problem of environmental pollution caused by solvent based polyurethane adhesives, the development of solvent-free polyurethane adhesives is currently vigorously promoted in China.

The global Solvent Free Retort Resistant Adhesive market size was estimated at USD 345.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
