### Report Overview

Soy Hull Pellet is a byproduct of the soybean processing industry, specifically derived from the outer shell or hull of the soybean. It is a sustainable and eco-friendly product, often used as a source of fiber and protein in animal feed, particularly for livestock such as cattle, pigs, and poultry. Soy Hull Pellets are created by removing the hulls from the soybeans during the oil extraction process, which leaves behind a high-fiber, low-fat material. These pellets are then formed by compressing the hulls into a dense, compact form, making them easier to store, transport, and use as a feed ingredient. They are valued for their ability to improve digestion and nutrient absorption in animals, as well as for their potential to reduce feed costs and environmental impact due to their renewable nature.
