### Report Overview

SPAD (Single-Photon Avalanche Diode) image sensors are advanced photodetectors capable of detecting individual photons with high sensitivity and timing resolution. These sensors operate by exploiting the avalanche multiplication effect in reverse-biased diodes, enabling ultra-low-light imaging and time-of-flight (ToF) applications. Unlike conventional CMOS or CCD sensors, SPADs excel in scenarios requiring high-speed, low-light, or precise photon counting, making them ideal for applications such as LiDAR, quantum computing, medical imaging, and scientific research. The technology's ability to provide depth mapping and 3D imaging with high accuracy has driven adoption in autonomous vehicles, augmented reality, and biometric security systems. As demand for high-performance imaging grows, SPAD sensors are increasingly integrated into consumer electronics, industrial automation, and defense systems, supported by advancements in semiconductor fabrication and miniaturization. Market growth is further fueled by the expansion of AI-driven applications, requiring real-time, high-resolution data capture in challenging environments. However, challenges such as high production costs, thermal noise, and manufacturing scalability remain barriers to mass adoption, though ongoing R&D aims to address these limitations.
