Report Overview

SPECT-CT Scanners, also known as Single Photon Emission Computed Tomography-Computed Tomography scanners, are advanced medical imaging devices that combine the capabilities of SPECT and CT technologies. SPECT is a nuclear medicine imaging technique that uses gamma-emitting radiotracers to visualize the distribution of specific biochemical processes within the body. CT, on the other hand, is a radiographic imaging technique that uses X-rays to create cross-sectional images of the body. The integration of these two technologies in SPECT-CT scanners allows for the simultaneous acquisition of functional and anatomical information, providing a more comprehensive and accurate diagnosis. These scanners are particularly useful in oncology, neurology, and cardiology, where precise localization of abnormalities is crucial for effective treatment planning. The combination of SPECT and CT data also enables better quantification of tracer uptake and improved image resolution, leading to enhanced clinical decision-making.
