Report Overview

A spectral color illuminance meter is an instrument used to measure the spectral distribution and color illuminance of a light source. It can measure the spectral energy distribution in different wavelength ranges and calculate the color illuminance of the light source based on the human eye's sensitivity to different wavelengths. Spectral color illuminance meters usually consist of an optical system and a spectral measurement device. The optical system is used to collect the radiant energy emitted by the light source and focus it onto the spectrum measurement device. Spectral measurement devices can use different techniques, such as gratings, interferometers or filters, to separate the different wavelength ranges of light emitted by a light source and measure its radiated energy. By weighting the radiant energy of light of different wavelengths, the color illumination of the light source can be calculated based on the sensitivity of the human eye to different wavelengths. Spectral color illuminance meters are widely used in lighting engineering, optical research, color display calibration, color measurement and optical instrument testing and other fields. It can provide important parameters such as spectral distribution, color temperature, and color index of the light source, which is of great significance for lighting design and color accuracy evaluation of color displays.
