Report Overview

A speed and cadence sensor is a device commonly used in cycling that provides real-time data on a cyclist's speed and pedaling cadence. Typically attached to the bicycle, these sensors use various technologies, including magnets and accelerometers, to measure the rotation of the bike's wheels and pedals. The speed sensor calculates the cyclist's speed by monitoring the wheel rotations, while the cadence sensor measures the number of pedal revolutions per minute. Cyclists use this data to monitor and optimize their training, track performance, and achieve specific cadence and speed goals. Speed and cadence sensors are often used in conjunction with cycling computers or smartphone apps to display and record the gathered information for analysis and training purposes.
