Report Overview

The spine surgery navigation platform is an advanced medical technology system designed to enhance the precision, safety, and efficiency of spinal surgical procedures. It integrates real-time imaging, 3D modeling, and computer-assisted navigation to provide surgeons with detailed anatomical guidance during operations, reducing reliance on traditional fluoroscopy and minimizing human error. These platforms typically include optical or electromagnetic tracking systems, intraoperative imaging tools, and specialized software for preoperative planning and intraoperative adjustments. By improving accuracy in instrument placement and alignment, spine navigation systems help mitigate risks such as nerve damage, misplaced screws, or incomplete decompression, leading to better patient outcomes. They are particularly valuable in complex cases like minimally invasive spine surgery (MISS), deformity correction, and revision surgeries, where anatomical landmarks may be obscured. The technology is increasingly adopted in hospitals and specialized spine centers, driven by rising demand for personalized, high-precision surgical solutions amid growing spinal disorder prevalence.
