Report Overview

Split flange bearings are a type of mechanical bearing designed to accommodate misalignments and support rotating shafts in various industrial applications. These bearings feature a split design in their outer ring, which allows for easier installation and maintenance without the need to disassemble the entire shaft or machinery. The split flange bearing consists of an inner ring, outer ring, and rolling elements, such as balls or rollers, enclosed within a cage. The outer ring's split design enables it to be bolted onto the shaft after the inner ring is already in place, providing flexibility and convenience in installation. These bearings are commonly used in applications where precise alignment is difficult to achieve or where frequent maintenance is required, such as in pumps, gearboxes, and other heavy machinery.
