Report Overview

A Spread Spectrum Clock Oscillator is an electronic component designed to generate a clock signal with a frequency spectrum that is intentionally spread over a wider range than the minimum required bandwidth. This technology is used to reduce the impact of electromagnetic interference (EMI) and radio frequency interference (RFI) by distributing the energy of the clock signal across a broader frequency range. The oscillator achieves this by modulating the output frequency with a pseudo-random noise signal, which results in a lower peak amplitude and a wider frequency distribution. This approach is particularly beneficial in high-speed digital systems, where clock signals can be a significant source of interference. The Spread Spectrum Clock Oscillator helps to minimize the potential for interference with other electronic devices and to comply with regulatory standards for EMI emissions.
