Report Overview

Stabilized Zirconia Products refer to a category of advanced ceramic materials that are composed of zirconium dioxide (ZrO₂), which has been modified with the addition of stabilizing agents to enhance its properties. These products are known for their exceptional mechanical strength, high fracture toughness, and excellent thermal and chemical stability. The stabilization is achieved through the addition of materials such as yttrium oxide (Y₂O₃), magnesium oxide (MgO), or calcium oxide (CaO), which help to maintain the zirconia in a more stable crystal phase, typically the cubic or tetragonal phase, even at room temperature. This process prevents the undesirable transformation to the monoclinic phase, which can lead to volume expansion and material degradation. Stabilized zirconia products are widely used in various industries, including electronics, aerospace, automotive, and medical applications, due to their high wear resistance, low thermal conductivity, and biocompatibility. They are commonly employed in components such as oxygen sensors, fuel cell electrolytes, dental implants, and cutting tools, where their unique combination of properties provides significant advantages over traditional materials.
