### Report Overview

Stand-type phototherapy equipment refers to medical devices designed to treat conditions such as neonatal jaundice, psoriasis, and eczema by exposing patients to controlled wavelengths of light, typically ultraviolet (UV) or blue light. These units are freestanding, often adjustable in height, and equipped with specialized light panels to ensure uniform exposure while minimizing risks of overheating or overexposure. They are commonly used in hospitals, clinics, and neonatal intensive care units (NICUs) due to their portability, ease of use, and ability to accommodate patients of varying sizes. The market for stand-type phototherapy equipment is driven by rising incidences of neonatal jaundice globally, advancements in LED-based phototherapy technology, and increasing healthcare infrastructure investments in emerging economies. At the same time, strict regulatory standards and high costs associated with advanced systems may pose challenges for market expansion. Growing awareness of non-invasive treatment options and the development of portable, energy-efficient devices further contribute to market growth, particularly in regions with high birth rates and limited access to specialized neonatal care.
