Report Overview

The steam jet heat pump (SJHP) is a thermal-driven heat pump system that utilizes steam or vapor as a working fluid to transfer heat from a low-temperature source to a higher-temperature sink by leveraging the ejector effect. Unlike conventional mechanical compression heat pumps, an SJHP operates without moving parts, relying instead on the entrainment and compression of low-pressure vapor through a high-velocity steam jet. This technology is particularly advantageous in industrial applications where waste steam is readily available, offering energy-efficient heat recovery and temperature upgrading. It is commonly employed in sectors such as chemical processing, food and beverage production, and district heating, where it enhances thermal efficiency by reusing otherwise wasted heat. The system's ability to operate at high temperatures (up to 150°C or more) makes it suitable for processes requiring significant heat input, while its simplicity and low maintenance requirements contribute to operational cost savings. However, its efficiency is highly dependent on steam pressure and temperature conditions, requiring precise design optimization for optimal performance.
