Report Overview

Steel resistant to sulfuric acid dew point corrosion refers to specialized steel alloys designed to withstand the highly corrosive conditions that occur when sulfuric acid condenses on metal surfaces at or below the dew point temperature, typically in industrial environments such as power plants, chemical processing, and waste incineration. This type of steel is engineered with enhanced resistance through alloying elements like chromium, nickel, and molybdenum, which form a protective oxide layer to mitigate acid attack. The material must maintain structural integrity under thermal cycling, moisture exposure, and acidic condensate, making it critical for applications in flue gas desulfurization systems, boilers, and heat exchangers where conventional carbon steel would rapidly degrade. Performance is often measured by corrosion rates in standardized tests simulating dew point conditions, ensuring reliability in harsh operational settings.
