Abstracts

The steel top iron skirt combined piston is an engine piston structure designed for high strength and wear resistance, and is widely used in heavy-duty diesel engines and other high-power output industrial machinery. The design feature of this structure is that the top of the piston is made of high-strength steel material, which can withstand high combustion pressure and temperature, while the piston skirt is made of cast iron material, which provides good thermal conductivity and wear resistance. The heat resistance and strength of the steel top enable the piston to maintain its shape and strength under high temperature and high pressure environments, while the use of the iron skirt reduces the overall manufacturing cost, while reducing the thermal expansion coefficient and enhancing the matching degree between the piston and the cylinder wall.

The global Steel Top Iron Skirt Combined Piston market size was estimated at USD 185.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
