Abstracts

A sterile calcium alginate wound dressing is a specialized medical dressing made from natural fibers derived from seaweed, specifically calcium alginate. This type of wound dressing is designed to provide an absorbent and conformable covering for wounds and ulcers. When in contact with wound exudate, the calcium alginate fibers form a gel-like consistency, facilitating a moist wound healing environment. This dressing is particularly suitable for moderately to heavily exuding wounds, such as pressure ulcers, diabetic ulcers, and surgical wounds. Sterile calcium alginate wound dressings are known for their absorbent properties, which help manage excess moisture and promote the natural healing process by creating an ideal environment for cell proliferation and tissue regeneration. The sterile nature of these dressings minimizes the risk of infection, making them a valuable tool in wound care management.

The global Sterile Calcium Alginate Wound Dressing market size was estimated at USD 385.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
