Report Overview

A Straight Dental Elevator is a specialized dental instrument designed for the purpose of luxating or elevating teeth during dental extraction procedures. It is typically made of stainless steel and features a straight, slender shaft with a flattened, angled end. This design allows the dentist to apply controlled force to the tooth, facilitating its movement out of the socket with minimal trauma to the surrounding tissues. The straight dental elevator is an essential tool in oral surgery, particularly for the removal of single-rooted teeth or when a tooth is firmly anchored and requires additional leverage for extraction. Its straight design provides a direct line of force application, which can be beneficial in certain extraction scenarios where a curved elevator might not be as effective.
