Report Overview

Straight pattern globe valves are a type of linear motion valve used to regulate or stop fluid flow in pipelines, featuring a vertical disc that moves perpendicular to the seat. These valves are distinguished by their straight-through flow path, which minimizes pressure drop compared to traditional globe valves with a Z- or Y-shaped body. They are commonly used in applications requiring frequent throttling or tight shutoff, such as steam, water, and oil & gas systems, due to their precise flow control and reliable sealing. Their design allows for easier maintenance and repair compared to angled or complex configurations, making them suitable for industries prioritizing operational efficiency and long-term durability. The straight pattern is particularly favored in high-pressure and high-temperature environments where flow resistance must be minimized without compromising sealing performance.
