### Report Overview

A straight stroke control valve is a valve used for fluid control, also known as a straight stroke actuator or a straight stroke valve. It is an automatic control device that adjusts the opening of the valve by receiving an external signal (such as an electrical signal or a pneumatic signal), thereby controlling the flow or pressure of the fluid. A straight stroke control valve usually consists of two parts: an actuator and a valve body. The actuator is the power part of the valve, which can adjust the opening of the valve according to the received signal. The valve body is the main part of the valve and is responsible for controlling the flow or pressure of the fluid. The working principle of the straight stroke control valve is: when receiving the control signal, the actuator will adjust the opening of the valve according to the magnitude and direction of the signal. For example, when the actuator receives an increasing signal, it opens the valve, increasing the flow of fluid; when the actuator receives a decreasing signal, it closes the valve, reducing the flow of fluid.
