Report Overview

Straw briquette fuel is a type of biomass fuel made from compressed agricultural residues, primarily straw, through processes like drying, crushing, and high-pressure compaction. It serves as an eco-friendly alternative to traditional fossil fuels like coal or firewood, offering advantages such as lower carbon emissions, higher energy density, and efficient combustion. The briquettes are commonly used in industrial boilers, household heating, and power generation, particularly in regions with abundant agricultural byproducts. Market demand is driven by increasing environmental regulations, rising fossil fuel costs, and government incentives promoting renewable energy. However, challenges include inconsistent raw material supply, logistical costs, and competition from other biomass fuels like wood pellets. Growth opportunities exist in expanding production efficiency, improving supply chain infrastructure, and leveraging carbon credit programs to enhance economic viability.
