Report Overview

A suction caisson is a type of large, cylindrical anchoring device used in offshore engineering to secure structures like oil platforms, wind turbines, and subsea installations to the seabed. It operates by being lowered into the seabed, after which the water inside is pumped out to create a vacuum, generating strong suction forces that anchor it firmly. This method provides significant holding power and is effective in various seabed conditions, including soft sediments and deep water. Suction caissons are valued for their ease of installation, minimal environmental impact, and ability to be installed and removed with precision.
