Report Overview

A Sulphur Recovery Unit (SRU) is an industrial process equipment designed to capture and convert sulfur compounds, primarily hydrogen sulfide (H₂S), into elemental sulfur. This is achieved through a series of chemical reactions, typically involving the Claus process, which involves combustion, conversion, and condensation stages. The SRU plays a crucial role in reducing environmental pollution by minimizing the release of sulfur dioxide (SO₂), a harmful gas contributing to acid rain and respiratory issues. It is commonly used in industries such as oil refineries, gas processing plants, and chemical manufacturing facilities to manage sulfur emissions and comply with environmental regulations. The SRU not only helps in mitigating the environmental impact but also recovers sulfur, which can be further processed and used in the production of sulfuric acid, fertilizers, and other sulfur-based products.
