### Report Overview

A Supercritical Once-through Boiler is a type of high-pressure boiler used in power generation and industrial processes. It operates at conditions where the temperature and pressure of water exceed its critical point (37.48°C and 22.12 MPa), resulting in a single-phase fluid known as supercritical fluid. This fluid exhibits unique properties, such as high heat capacity and low viscosity, which enhance heat transfer efficiency. The once-through design implies that water enters the boiler, is heated to the supercritical state without boiling, and then expands through a turbine to generate electricity or mechanical work. This system minimizes the need for large storage drums and reduces thermal stress, leading to improved efficiency and reduced operational costs. The Supercritical Once-through Boiler is characterized by its ability to operate at high efficiency levels, typically above 38%, and its flexibility in handling various types of fuels, making it a preferred choice for modern power plants seeking to optimize energy output and minimize environmental impact.

In 2024, the global Supercritical Once-through Boiler market is projected to reach approximately USD xx Million, with expectations to grow at a compound annual growth rate (CAGR) of around xx between 2024 and 2033.
