Report Overview

Suplatast tosilate is a pharmaceutical drug primarily used for the treatment of moderate to severe asthma in adult patients. It functions as an immunomodulatory agent, which means it modulates or influences the immune system's response. Specifically, suplatast tosilate works by inhibiting the production of certain cytokines, which are proteins involved in cell signaling and immune responses. This inhibition helps to reduce inflammation and airway hyperresponsiveness, which are key factors in asthma. The drug is typically prescribed as an oral medication and is taken once daily. It is important to note that suplatast tosilate is not a bronchodilator and should not be used as a substitute for rescue inhalers during acute asthma attacks. Its use is intended to be part of a comprehensive asthma management plan, often in conjunction with other asthma medications.
