Abstracts

SAW (Surface Acoustic Wave) is an elastic wave that propagates only in the vicinity of a piezoelectric material surface. The nature of the propagation of elastic waves near a solid surface, one of which is a gas, a liquid, a vacuum, or another solid material, is different from that of infinitely expanding (bulk) solids, liquids, or gases. In particular, when the solid substrate material is a piezoelectric material, the piezoelectric effect (piezoelectric effect) generates a surface acoustic wave (SAW) that propagates near the surface in a specific direction when subjected to strain. The propagation speed of a SAW is about 1 to 5 km/s, about 1/100,000th of the speed of electromagnetic waves, making it possible to miniaturize the circuit.

The global Surface Acoustic Wave Saw Device market size was estimated at USD 1265.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
