### Report Overview

Surgical bone wax is a sterile, non-absorbable material primarily composed of beeswax and softening agents like petroleum jelly or isopropyl palmitate, used to control bleeding from bone surfaces during orthopedic, neurosurgical, and dental procedures. It acts as a mechanical barrier to seal bone cavities and reduce blood loss, particularly in procedures involving cancellous bone. The product is available in various formulations, including traditional wax-based versions and newer absorbable alternatives designed for enhanced biocompatibility. Its effectiveness, ease of application, and cost-efficiency have made it a standard in surgical settings, though advancements in hemostatic agents are gradually reshaping its market position.
