### Report Overview

Surgical Endoscopic Vessel Harvesting Systems are advanced medical devices designed for the minimally invasive extraction of blood vessels, primarily for use in coronary artery bypass grafting (CABG) procedures. These systems typically consist of a long, flexible endoscope equipped with a high-resolution camera and specialized surgical instruments, such as dissectors and scissors, which are used to gently separate the target vessel from surrounding tissues. The systems allow surgeons to perform vessel harvesting through small incisions, reducing patient trauma, post-operative pain, and recovery time compared to traditional open harvesting techniques. Key features of these systems may include ergonomic design for ease of use, advanced imaging for precise vessel identification, and integrated tools for efficient dissection and extraction. The primary goal of using such systems is to improve patient outcomes by minimizing complications associated with vessel harvesting and promoting faster healing.
