### Report Overview

The Surgical Image Navigation System is a sophisticated medical technology designed to enhance the precision and accuracy of surgical procedures. This system utilizes advanced imaging techniques, such as computed tomography (CT), magnetic resonance imaging (MRI), or fluoroscopy, to create detailed, three-dimensional representations of the patient's anatomy. It then overlays these images onto the surgeon's field of view, providing real-time guidance and navigation during surgery. The system's primary goal is to minimize invasiveness, reduce complications, and improve patient outcomes by allowing surgeons to accurately locate and target specific anatomical structures, even those that are not directly visible. This technology is particularly beneficial in complex surgeries, such as neurosurgery, orthopedics, and spinal procedures, where precise navigation is critical for success.
