Report Overview

Surgical patties and strips are specialized medical devices used primarily in surgical settings to absorb fluids, protect tissues, and assist in maintaining a clear operative field. Typically made from highly absorbent materials such as cotton, rayon, or a blend of synthetic fibers, these products are designed to be sterile, lint-free, and radiopaque (to ensure visibility under imaging). Surgical patties are small, flat, and often square-shaped, while strips are longer and narrower, allowing for precise placement in confined spaces. They are commonly used in neurosurgery, orthopedic procedures, and general surgery to control bleeding, isolate delicate structures, or wick away fluids. The demand for these products is driven by their essential role in improving surgical outcomes, reducing infection risks, and enhancing procedural efficiency. With advancements in material science and increasing surgical volumes globally, the market for surgical patties and strips continues to expand, supported by stringent regulatory standards and the growing adoption of minimally invasive techniques.
