Report Overview

Suspended Growth Treatment Systems (SGTS) are advanced wastewater treatment technologies designed to efficiently manage and treat various types of wastewater, including domestic sewage, industrial effluents, and agricultural runoff. These systems utilize a combination of physical, chemical, and biological processes to remove contaminants, suspended solids, and nutrients from the wastewater. The primary components of SGTS include sedimentation tanks, aeration basins, and clarifiers. In the sedimentation tanks, suspended particles settle due to gravity, while aeration basins facilitate the growth of microorganisms that consume organic matter and nutrients. Clarifiers separate the treated water from the biomass, allowing for the discharge of clean water or its reuse. SGTS are known for their high treatment efficiency, operational flexibility, and ability to handle fluctuating influent loads, making them suitable for various applications in environmental management and water resource recovery.
