Report Overview

The Suture Anchor System is a medical device primarily used in orthopedic surgeries, specifically for the repair and reconstruction of soft tissues, such as tendons and ligaments, to their respective bone attachments. This system consists of a small anchor, typically made of biocompatible materials like PEEK (polyetheretherketone) or titanium, which is inserted into the bone to provide a secure point of attachment. Sutures or wires are then passed through the anchor and tied to the soft tissue, effectively reattaching it to the bone. The Suture Anchor System is designed to facilitate healing by promoting stable fixation and reducing the risk of re-injury. It is commonly used in shoulder, knee, and hip surgeries, among others, to address issues like rotator cuff tears, ACL reconstructions, and other ligament and tendon repairs. The system's design aims to minimize surgical invasiveness, enhance patient recovery times, and improve the overall surgical outcome.
