## Abstracts

Targeted protein degradation technology involves the design and development of small molecules or biologics that selectively bind to specific proteins within cells and mark them for degradation by the cell's natural protein degradation machinery, such as the ubiquitin-proteasome system or lysosomes. This approach enables the removal of disease-causing or undesirable proteins, including those considered 'undruggable' by traditional small molecule inhibitors, by harnessing the body's own degradation pathways. Typically, targeted protein degraders consist of a ligand that binds to the target protein, a linker, and a component that recruits the cellular degradation machinery. This technology holds promise for the treatment of various diseases, including cancer and genetic disorders, by targeting proteins involved in disease pathways with high specificity and efficacy.

The global Targeted Protein Degradation Technology market size was estimated at USD 2450.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 24.80% during the forecast period.
