Report Overview

Taste masking excipients are specialized ingredients used in pharmaceutical formulations to improve the palatability of oral medications by masking unpleasant tastes, particularly in pediatric and geriatric populations where compliance is critical. These excipients work by physically or chemically interacting with active pharmaceutical ingredients (APIs) to block bitter, sour, or otherwise undesirable flavors without compromising drug efficacy. Common types include polymers, lipids, sweeteners, and flavoring agents, often incorporated into coatings, microencapsulation systems, or ion-exchange resins. The demand for taste masking excipients is driven by the growing need for patient-friendly dosage forms, such as chewable tablets, oral suspensions, and orally disintegrating tablets (ODTs), as well as the expansion of the generic drug market requiring reformulation of off-patent drugs with poor taste profiles.
